How to Make Peace Without Killing Each Other

Sylvain Saucier

Part I – Why We Keep Killing Each Other

(The Wrong Map)

1. The Mistake of Mirrors

When people talk about making peace, they almost always mean one thing: **balance the forces**.
Give both sides enough weapons that attacking is suicide.
Build opposing armies, equal in strength, frozen in a stalemate.

Call it deterrence, call it power symmetry, call it the balance of terror.
It has a seductive, mechanical logic. If neither side can win, neither side will fight.

And it works—for a while.
A sheet of ice can hold a boulder for a long time, too. But ice isn't structure; it's a temporary phase.

The mistake is to confuse a paused fight with a healed relationship. If I hold a gun to your head and you hold a gun to mine, we have perfect balance. Are we at peace?

The trouble is that this model treats nations, tribes, and peoples as if they were billiard balls: inert objects moved only by external force. It

imagines that violence is a rational calculation that can be corrected by adjusting the costs. But humans—and the societies they form—are not billiard balls. They don't just collide; they interpret, they resent, they dream. A balance of power that ignores these inner currents is a dam built over a volcano.

Worse, the mirror-symmetry logic trains everyone to see the world as a zero-sum board. Every gain for them is a loss for us. Every act of kindness is a trick. Every compromise is a prelude to betrayal. Under this logic, even the peacemakers become paranoid.

And the paranoia isn't crazy, because the symmetry game guarantees that the moment one side gains an edge, the other must strike first or perish. So both sides spend their peace preparing for war, which slowly warps their economies, their education, their myths, until war is not an option but an identity.

So the first thing we must do in a book about making peace is to admit that **the strategic balance model is not a path to peace; it is a long-duration fuse**.

This doesn't mean we ignore military realities. It means we stop pretending they are the foundation of peace. The foundation of peace is something else entirely—something that has to do with how living systems regulate themselves. And to understand that, we need to look at what we actually are.

---

2. Autoimmune Humanity

We are not a collection of separate billiard balls.
Humanity is a single, sprawling living system.

I mean that literally, not poetically. A city breathes in resources and exhales waste. A nation has a metabolism, a memory, an immune response. The entire human species has become a networked superorganism whose nervous system is the internet, whose circulatory system is global trade, whose gut is industrial agriculture.

And if humanity is a living body, then war is an autoimmune disease.

Consider what happens in an autoimmune disorder. Some part of the body's own tissue gets mistaken for a foreign invader. Perhaps a few

cells display an unusual protein, or a signal gets misinterpreted. The immune system, which exists to protect the whole, launches a ferocious attack against itself. It sends killer cells to destroy perfectly healthy tissue. The body fights a war inside its own borders, and often the weapons—inflammation, fever, scarring—do more damage than the initial trigger.

Now look at a war. Two groups of the same species, often genetically indistinguishable, sharing the same planet, the same biology, the same fundamental needs, suddenly decide the other is a parasite that must be eliminated. The "impurity" is usually a story—a difference of flag, of book, of ritual, of historical grievance. The immune system of the group tags the neighbor as "non-self" and mobilizes to purge it. The weapons—bombs, sanctions, hate propaganda—destroy the shared infrastructure, the shared ecology, the shared future.

If you could zoom out and see the whole Earth as one organism, every bombing run would look like a hand attacking a foot. Every genocide would look like a spleen trying to destroy the liver because the liver sang the wrong song.

The autoimmune analogy is not just a clever image. It suggests a whole different way of thinking about what peace requires. You don't cure lupus by putting half the immune system on one side of a room and the other half on the other side and telling them to stare at each other until they calm down. You don't treat rheumatoid arthritis by giving each inflamed joint its own arsenal so that no joint can overpower the others. That would be absurd.

Yet that's exactly what the balance-of-power doctrine prescribes: an armed truce between two inflamed identities.

Instead, to heal an autoimmune condition, you must go to the root: the failure of the immune system to recognize "self." You have to rebuild the signaling pathways that say *this is us, this is safe, this belongs.* You calm the overactive attack, not by threatening it with counter-attack, but by restoring the regulatory mechanisms that keep the system whole.

Applied to humanity, that means the real work of peace is restoring the capacity of one part of the superorganism to recognize another part as itself. It means rebuilding the feedback loops that would normally tell a nation, a tribe, a religion that the people across the river are not a virus—they are a limb, and if you cut them off, you bleed.

So if we want to make peace without killing each other, we must stop thinking of peace as an external ceasefire and start thinking of it as an internal healing.

That shift in perspective brings us to the most stubborn obstacle of all: the way we think about the future itself.

---

3. The Demon's Conceit

There is an old fantasy in science and philosophy.
Laplace, an 18th-century mathematician, imagined a super-intelligence that knew the position and velocity of every particle in the universe, and all the laws of physics. For such an intellect, nothing would be uncertain. The whole future and the whole past would be present before its eyes.

Laplace's demon.

The demon is the ultimate expression of determinism—the belief that the future is already fixed, like a movie already filmed, and we are merely watching it play out frame by frame.

This belief is not just an abstract philosophical position. It has leaked into our politics, our psychology, our peacemaking. When a conflict seems eternal—say, Israelis and Palestinians, or Hindus and Muslims, or the Cold War—people start to talk as if the conflict is "inevitable." They speak of cycles of violence, of deep-seated hatreds, of the impossibility of resolution. They become deterministic: the future is already written, and it's written in blood.

And that belief is the greatest enemy of peace. Because if the future is fixed, why try? If the next war is inevitable, why not just prepare for it now and at least be the winner? Determinism of the mind breeds passivity of the will.

But Laplace's demon has been quietly refuted, not by philosophers, but by a tiny computer program I wrote called the Seedy device.

The Seedy Argument in Plain Words

Imagine three ants running in a circle on your desk. Each ant watches the ant ahead of it. When it sees the other ant move, it does a little calculation and then takes a step, which the next ant then watches. You start all three

ants at exactly the same spot, with exactly the same instructions, and you let them go.

What happens? You'd think, because they start identically, they'd all march in perfect lockstep forever. But they don't. They quickly fall into a chaotic, unpredictable dance. In fact, if you run the experiment again from the exact same starting point, you get a completely different dance. And if you only watch the very first step of each run, you'll eventually see *every possible first step* that the three ant's rules allow.

How is that possible? The instructions are deterministic. The starting point is identical. There's no coin flip. The magic is that the three ants form a loop: A depends on B, B depends on C, C depends on A, all at the same instant. That loop cannot be untangled on paper. To know what A will do, you must first know what B will do, which requires knowing what C will do, which requires knowing what A will do. The equations cannot be solved in advance. The only way to find out what happens is to actually run the system—to let time and physics resolve the mutual dependencies, consuming real energy and producing a unique outcome that simply did not exist before.

The Seedy device shows that even in a perfectly deterministic world, a system with self-reference has no predetermined future. The future is not a train track; it is a cloud of possibilities, a cone of probability. Most of the time, without any special push, the system settles into the fat center of that cone—the boring, "most probable" path. But the edges of the cone, the unlikely outcomes, are just as real.

Why does this matter for peace? Because our current "inevitable vector" toward further conflict is nothing more than the fat center of the cone. It's the easiest resolution of all our current social loops—but it's not the only possible resolution.

And here's the pragmatic twist: we, as conscious parts of the system, can deliberately skew the resolution. We can exert effort, burn energy, change the loops so that an outcome that was merely a thin sliver on the edge becomes the new center.

Determinism is false. The future is not yet written. And that means peace is always possible, no matter how stacked the deck appears.

So far, we've identified three fatal errors that keep us killing each other:
1. We think peace is a military balance, when it's not.

2. We treat ourselves as separate objects, when we are a single organism with an autoimmune condition.
3. We believe the future is fixed, when it's an open cone we can tilt.

Now let's build the correct map—the map that treats humanity as a living, creative, self-healing system and shows us how to navigate toward health.

Part II – The Real Anatomy of Peace

(A Living Map)

4. The Social Organism

Everywhere you look, life organizes into larger lives.
Single cells joined into multicellular bodies. Individual bees joined into a hive mind. Individual humans joined into families, tribes, cities, nations, civilizations.

These larger entities are not just metaphors. They satisfy every scientific definition of a living system:
- They maintain their internal order despite external chaos (homeostasis).
- They take in energy and matter and excrete waste (metabolism).
- They respond to their environment and adapt (responsiveness).
- They grow, change, and occasionally reproduce (development and reproduction).
- They are composed of smaller living units that sacrifice some autonomy for the good of the whole (hierarchical organization).

A forest is a slow, green animal. A city is a buzzing hive of concrete and flesh. A religion is a social organism that spans centuries and continents, with a genome of stories and rituals.

When you start seeing humanity this way, some stubborn old questions dissolve.

"Why can't we all just get along?" Because a living body isn't a democratic assembly; it's a balancing act of thousands of competing subsystems—hormones, nerves, organs, microbes—each with its own local interests. The heart wants blood pressure high enough to pump;

the kidneys want it low enough to filter. They don't "agree"; they regulate each other through feedback.

"Is conflict natural?" Yes, as natural as the competition between the immune system and a pathogen, or between the need for sleep and the need to hunt. The question isn't whether conflict exists; it's whether the larger body has the regulatory mechanisms to keep conflict constructive rather than destructive.

"What is a nation, really?" A nation is a shared story that coordinates millions of individual metabolisms into a coherent collective action. When the story is healthy, it enables cooperation at scale. When the story becomes rigid and closed—an ideology that refuses feedback—it becomes a tumor.

So the first principle of the living map is: **The unit of peace is not the individual, not the state, but the health of the whole superorganism.**

And the second principle follows directly: **To heal the whole, we must understand the vital signs of a living society.**

---

5. Three Vitals of Any Living Society

Every living system, from a single cell to a global civilization, depends on three deep competencies. Think of them as the vital signs a doctor checks: heart rate, blood pressure, temperature. If any one of them crashes, the organism dies.

For a social organism, the three vitals are:

1. Feedback and Learning
The ability to feel the consequences of your actions and adjust.

A body without a nervous system cannot sense injury; it will blunder into a fire and burn without flinching. A society without feedback cannot see the harm its policies cause. It becomes deaf and blind.

Feedback means: when a law creates suffering, that suffering must be visible to the lawmakers, quickly and clearly. When a company pollutes a river, the people downstream must have a powerful voice that reaches the boardroom. When a dominant cultural group marginalizes a minority, the minority's pain must be felt as a wound in the whole social body.

Short feedback loops are the immune system of society. Long, broken, or corrupted feedback loops are the start of every cancer.

2. Curiosity and Exploration
The drive to understand what you do not yet understand.

A body that cannot explore its environment cannot find food. A mind that cannot question its own assumptions cannot learn. A society that silences dissent, bans books, or declares certain subjects off-limits is a society amputating its own sensory organs.

Curiosity is not a luxury for the leisurely. It is the mechanism by which a system discovers new possibilities, adapts to changing circumstances, and avoids the brittle monoculture that a single shock can shatter.

Spiritually, curiosity is the open hand toward mystery. Every great breakthrough—moral, scientific, artistic—began with someone daring to ask a question that the orthodoxy of the day considered dangerous.

3. Respect and the Protection of the Fragile
The deliberate care for what is easily broken.

In any complex system, certain things are precious and rare: a child's trust, a minority language, a delicate ecosystem, a dissident voice, a pregnant possibility. They are easily crushed by the efficient machinery of the majority. They carry the seeds of future diversity.

Respect is the force that pushes back against optimization. It insists that some things must be protected even when they are not powerful, not profitable, not popular. It is the root of compassion, mercy, ahimsa, and the golden rule.

A society that loses respect becomes a brutal machine that grinds its own weakest parts into dust—and soon discovers that the dust was load-bearing.

These three vitals—feedback, curiosity, respect—are not moral suggestions. They are the non-negotiable requirements for any long-lived, healthy, evolving system.
When they all function strongly, the social organism hums with life. When one or more are broken, the organism slides toward disease.

And the direction of disease—or health—can be mapped.

---

6. The Color of Health

Imagine a three-axis space. One axis measures feedback (from short and honest, to long and corrupted). Another measures curiosity (from open and playful, to closed and dogmatic). The third measures respect (from fierce protection of the fragile, to ruthless sacrifice of the weak).

Any society, institution, movement, or even individual life can be located somewhere in this cube.

There is one corner where all three vitals are maximally healthy: (+Feedback, +Curiosity, +Respect). Call this the **Constructive Attractor**.

There is the opposite corner where all three are maximally broken: (-Feedback, -Curiosity, -Respect). Call this the **Destructive Attractor**.

The Constructive Attractor is the direction of GOOD. It is where complexity grows, diversity flourishes, and the future becomes richer.
The Destructive Attractor is the direction of collapse, tyranny, and death. It is where life simplifies into ash.

Between these two poles are the fuzzy middles—the various trade-off zones where real human life actually happens. A rigid but gentle tradition might have low curiosity but high respect. A ruthless technocracy might have high feedback and curiosity but no protection for the fragile. None of these are hell; they are simply states that signal a need for correction.

The crucial insight is that these attractors are not just descriptions; they are *forces*.
A system drifting toward the Destructive Attractor will actively resist feedback, punish curiosity, and sacrifice the fragile. It will create ideologies that justify its drift.
A system moving toward the Constructive Attractor will seek out feedback, encourage questions, and build shelters for the vulnerable.

The question for peacemaking then becomes not “Who is right?” but “In which direction is this action, this policy, this story pulling the whole?”

This is a practical tool. When a leader proposes a wall, ask: Does this shorten feedback between the two sides? Does it open or close curiosity about the other? Does it shield the fragile or sacrifice them for a sense of security?

When a peace agreement is on the table, ask the same questions. Don't just ask if it distributes land or weapons fairly. Ask if it builds mechanisms that will shorten feedback loops between the former enemies, foster curiosity about each other's experience, and protect the fragile on both sides from the backwash of the peace.

The map is simple. The navigation is the work of a lifetime.

---

7. Time as Dice

We already met the Seedy device, but now we must place it at the heart of the living map.

The living-systems view tells us that the future is not predetermined; it is a probability cone. The fat center of the cone is what will happen if we change nothing—the path of least resistance, the default resolution of all our current mutual dependencies.

But the edges of the cone are not miracles. They are genuine potential futures, just less probable under current conditions.

Think of a war-prone region as a ring of three ants: multiple groups with mutual dependencies, mutual narratives, mutual provocations. The default resolution of their loops—the fat center—may be another cycle of retaliation. But that resolution is not fated. It is simply the easiest one for the loops to fall into, given their current configuration.

If you change the configuration—if you add a new feedback loop, introduce a shock of curiosity, protect a fragile bridge-building initiative—you are, in effect, rewriting the rules the ants are running. You tilt the cone. An outcome that was a 1% probability can become a 30% probability, then an 80% probability.

This is not wishful thinking. It's a direct consequence of how self-referential systems resolve. The Seedy device is proof that from the exact same starting conditions, completely different outcomes are possible. And it is also proof that the system can be nudged toward those outcomes by deliberate intervention.

That's what free will is, in a cybernetic sense: not a magical escape from causality, but the capacity of a self-referent system to participate

in its own resolution. We are part of the loop. Our choices become new constraints that steer the resolution.

Therefore, despair is not realism; it's a mathematical mistake. It confuses the fat center with the whole cone. And it is that confusion—that false determinism—that often prevents us from making the very interventions that could tilt the cone toward peace.

So now, with the map in hand, we can turn to the practical art of tilting.

Part III – Freeing the Will, Tending the Body

(How to Skew the Cone)

8. The Edge of the Cone

Before we get into the mechanics, we must take a moment for hope. Not sentimentality—strategic hope.

History is littered with moments where the fat center of the cone seemed to make disaster inevitable, and yet the disaster was averted by a thin-slice intervention.

- The Cuban Missile Crisis: two superpowers locked in a deterministic spiral toward nuclear exchange. The resolution came not from military symmetry (the balance was already there) but from backchannel feedback, curiosity about the other's actual fear, and a decision to protect the fragile—the children, the cities, the future.
- South Africa's transition from apartheid: the fat center of the cone was a bloodbath. The actual resolution was tilted by truth-telling (feedback), the willingness to imagine a shared nation (curiosity), and the painstaking protection of fragile bridge-builders on all sides (respect).
- The end of the Cold War: not through victory but through a cascade of feedback—ordinary people refusing to be lied to, a leader (Gorbachev) willing to explore radical curiosity about alternative systems, and, though imperfect, a moment of mutual respect that allowed the dissolution of an empire without a single shot between the superpowers.

In each case, the peacemakers did not have perfect information or guaranteed success. They simply recognized that the default future was not

the only future, and they took actions that shifted the odds.

The practical lesson: you do not need to guarantee peace. You only need to shift the probability enough that the peaceful resolution becomes more attractive, more stable, more alive than the old violent loop.

How do you do that? By deliberately strengthening the three vitals in the conflict system.

---

9. Shortening the Loop

The single most powerful action you can take toward peace is to **shorten the feedback loop between potential adversaries**.

Most violent conflicts are sustained by information bubbles. Each side lives in a media environment that filters out the other's humanity, that amplifies grievances, that makes the other's pain invisible. The loop is long and corrupted.

To shorten it:
- Create spaces where the stories of the vulnerable are heard directly—not through intermediaries who spin them.
- Support independent journalism, citizen reporting, and human-rights monitoring that track the real consequences of policies on both sides.
- Design governance systems where decision-makers are forced to face the communities their decisions affect, in person, regularly—not just through polls or reports.
- In your own life, refuse the convenience of not knowing. If a product you buy is made by exploited labor, find out. If a policy you support hurts a group you never meet, go meet them.

Short feedback loops are uncomfortable. They burn energy. That's the point. The discomfort is the body's signal that something is wrong. Numbness is not peace; it's pre-gangrene.

At the international level, this means things like:
- Truth and reconciliation commissions that make perpetrators face victims.
- Cross-border community exchanges that let ordinary people see each other as neighbors, not news headlines.
- Rapid-response conflict early-warning systems that make escalation

visible before it's too late.

Every time you shorten a loop, you reduce the chance that the social body will attack itself blindly.

---

10. Re-complicating the Image

The second lever is curiosity.

War propaganda always does one thing: it simplifies the enemy into a cartoon. A single, hateful, subhuman face. That simplification is a psychological necessity because it's hard to kill a complex human being with a family, a sense of humor, and a favorite song.

So the peacemaker's counter-move is to re-complicate the image. Not to excuse atrocities, but to restore the full humanity of the other, because only then can real negotiation, real empathy, real peace emerge.

Practically:
- Support art, film, and literature that crosses the lines of conflict and tells the stories that the official narratives suppress.
- In education, teach multiple perspectives on history, including the perspectives of former enemies. Not to relativize truth, but to expand it.
- In dialogue, forbid the use of dehumanizing labels. Insist on naming the specific actions and the specific people, not the caricatures.
- Cultivate the spiritual practice of radical curiosity: the discipline of asking "What does the world look like from their side?" without immediately rushing to judge.

Curiosity is not a betrayal of your own side. It's an intelligence-gathering operation that reveals the true terrain of the conflict. And very often, it discovers that the enemy's fears and hopes are not so different from your own.

That discovery is the beginning of the end of war.

---

11. Shielding the Fragile

The third lever is respect.

In every conflict, there are fragile things that can tip the balance toward health or destruction: the moderate voices, the cross-community families, the children, the ecosystems, the nascent institutions of cooperation.

A society sinking toward the Destructive Attractor will systematically crush these fragile things. It will label peace-seekers as traitors, starve trans-border economies, poison shared water supplies, and sacrifice the young to feed the old hatred.

A peacemaker's task is to identify the fragile and build a shield around it.

- Protect dissidents and bridge-builders from persecution, using international pressure, safe havens, and public solidarity.
- Invest in the ecological commons—shared rivers, shared air, shared climate—because a dying environment can push any tension into war.
- Prioritize the well-being of children on all sides, because children's memories are the seeds of the next generation's either peace or revenge.
- Defend minority cultures and languages as treasures of the whole human organism, not as obstacles to national unity.

Respect is not always passive. Sometimes it requires fierce protection—the kind of fierce that refuses to let the powerful trample the weak. But the fierceness is on behalf of life, not against life.

And when all three levers—feedback, curiosity, respect—are pulled together, the cone tilts. Sometimes slowly, sometimes suddenly. But it tilts.

---

12. Immune Therapies

It helps to see these principles in action. History is full of peace movements that, knowingly or not, acted as the social body's own regulatory system, calming the autoimmune storm.

Consider **Gandhi's satyagraha**. It worked not because the British Empire suddenly developed a conscience, but because Gandhi systematically shortened the feedback loop. He forced the Empire to see the consequences of its rule—the salt marches, the boycotts, the spectacle of nonviolent suffering—making the cost of oppression impossible to ignore. He re-complexified the image of Indians from "subject race" to morally powerful agents. And he fiercely protected the fragile—insisting that

the movement remain nonviolent, defending the dignity of the weakest, refusing to sacrifice the vulnerable for tactical gain.

Or take the **Northern Ireland peace process**. Decades of tit-for-tat violence seemed deterministic. The turning point was a slow, painful knitting of feedback loops (the Good Friday Agreement's cross-community institutions), a re-complicating of narratives (the admission that both sides had grievances and both sides had blood on their hands), and a deliberate protection of the fragile ceasefire moments against spoilers.

The **anti-apartheid movement** succeeded not just by isolating the regime economically, but by building a global feedback system that made white South Africans feel the world's repulsion, by fostering curiosity through cultural boycotts that broke the cultural bubble, and by protecting the fragile—the black majority, the white dissenters, the vision of a rainbow nation—until the old system collapsed under its own contradictions.

None of these were perfect. All had their own shadow sides. But they all demonstrate the same pattern: peace is not achieved by balancing swords. It is achieved by nurturing the social organism back to health.

Part IV – Building the Compass

13. A Compass, Not a Map

Up to this point, I've been describing a diagnostic—a way to see the health of a social body. But a person standing in the middle of a complex situation needs more than a description; they need a tool they can use in real time to orient their own decisions.

That tool is the Cube.

The Cube is simply the three-axis space we already explored: Feedback, Curiosity, Respect. But now imagine it as a physical or mental device—a compass you can consult.

When facing any decision, personal or political, ask:
- Will this action shorten or lengthen the feedback loop between me and those affected?

- Will it open or close the space of curiosity?
- Will it protect or endanger the fragile?

You don't need perfect answers. The act of asking itself begins to rewire your instincts. Over time, you start to feel the pull of the Constructive Attractor and the repulsion of the Destructive Attractor. The Cube becomes an inner gyroscope.

It doesn't tell you what to believe. It doesn't prescribe a list of rules. It is not an ideology. It's a meta-tool that works with any religion, any culture, any personal philosophy. A Christian, a Muslim, a secular humanist can all use the Cube because it doesn't replace their core commitments; it only helps them navigate the *consequences* of those commitments.

And when used collectively—by a community, an institution, a diplomatic process—the Cube shifts the conversation from "Who is righteous?" to "What are we building together?"

---

14. The Art of Self-Regulation

A compass is useless without the practice of navigation.

Using the Cube regularly—daily, weekly, in moments of crisis—is a skill. It's like learning to read the stars. At first it's awkward and abstract. Later, it becomes intuitive.

The practice can take many forms:
- A personal journal where you review the day's decisions against the three axes.
- A family ritual where you discuss a recent conflict and ask together how to move toward more feedback, more curiosity, more respect.
- An institutional meeting that begins not with the agenda, but with a check-in on the health of the group's feedback loops.
- A national dialogue where proposed laws are publicly evaluated on the Cube before a vote.

The point is regularity. You build the muscle of self-regulation by using it. And as with any muscle, it weakens with disuse.

The great exemplars—Jesus, Mohamed, Buddha, Gandhi, King—were not people who achieved a static perfection. They were people who,

through relentless practice, aligned themselves so deeply with the Constructive Attractor that their very presence tilted the cone around them. They became living compasses.

We don't have to be exemplars. We just have to practice.

Conclusion – The Necessity of Dice

Einstein famously said, "God does not play dice."
He was rejecting the randomness of quantum mechanics, clinging to a universe that was fully determined, fully knowable, fully safe.

But Einstein was wrong, and not just at the quantum level. The universe plays dice in its very structure. Self-reference—the mutual dependence of parts on each other—is built into the fabric of reality. That self-reference means no future is fully determined. Every moment is a genuine resolution of a constraint network, a throw of cosmic dice.

The same is true of human beings. We are a society of societies, a body of bodies, a mind of minds, all mutually dependent, all influencing each other's resolutions. We cannot predict the future. We can only tilt the dice.

Making peace without killing each other is not about enforcing a stalemate. It's about learning to tilt the dice toward the Constructive Attractor. It's about shortening feedback loops, restoring curiosity, and shielding the fragile—every day, in every relationship, in every institution.

The demons of determinism whisper that it's impossible: the hatreds are too old, the interests too entrenched, the cycles too vicious.

The Seedy device whispers back: *From the same zero state, any number can appear.*

The future is not a prison. It's a garden that we tend with our attention.

Let us tend it toward life.

The Constructive Attractor Across Traditions

1. Christianity

Feedback: Jesus' ministry is a masterclass in short-circuiting the long, corrupt loops of power. He touches lepers (instant feedback on their exclusion), dines with tax collectors, and tells the rich young ruler to sell everything—a direct, uncomfortable mirror. The parable of the Sheep and the Goats (Matthew 25) makes judgement dependent on whether you fed the hungry, clothed the naked, visited the prisoner: all acts of immediate, embodied feedback to fragility.
Curiosity: "Seek and you will find; knock and the door will be opened." The entire Sermon on the Mount urges a radical re-examination of received law—not abolishing it, but exploring its deeper, compassionate logic. Jesus asks questions constantly: "Who do you say I am?" "Which of these three was a neighbor?"
Respect for the fragile: The beatitudes bless the poor in spirit, the meek, the persecuted. Jesus says whoever causes a little one to stumble should have a millstone hung around their neck. The early Church's care for widows and orphans became its defining social identity.

---

2. Islam

Feedback: The Qur'an repeatedly demands *shura* (mutual consultation) as a principle of community governance. Zakat (obligatory charity) is a direct feedback mechanism that transfers wealth from the advantaged to the fragile, reminding both of their mutuality. The concept of *hisbah* (accountability) obliges Muslims to enjoin good and forbid wrong—a daily, person-to-person feedback loop.
Curiosity: The first revealed word, "Iqra" (Read!), is an imperative to seek knowledge. The Prophet Muhammad says, "Seek knowledge even unto China." The Qur'an itself invites inquiry: "Do they not reflect upon the Qur'an?" and "Will they not reason?"
Respect for the fragile: Orphans, widows, travelers, and the poor are a constant refrain. "Have you seen the one who denies the religion? That is the one who drives away the orphan." The Prophet's last sermon insists on the inviolability of life, property, and honor, and specifically commands kindness to women and servants.

---

3. Judaism

Feedback: The prophetic tradition is a relentless, short-feedback system. Nathan confronts King David ("You are the man!"); Isaiah denounces fasting that ignores the oppressed; Amos calls for justice to "roll down like waters." The Passover Seder annually re-creates the Exodus experience, making the suffering of ancestors immediate and live.
Curiosity: The entire Talmudic method is curiosity enshrined: every law examined, argued, reinterpreted. Abraham himself bargains with God over Sodom—a paradigm of exploring the moral boundaries. The tradition of *chavruta* (study partnership) is built on the conviction that truth emerges through questioning.
Respect for the fragile: *Tzedakah* is not charity but justice. The Torah repeatedly commands protection for the stranger, the orphan, and the widow, with the recurring reminder: "You were strangers in Egypt." The idea of *tikkun olam* (repairing the world) focuses on mending the fractures that leave some powerless.

---

4. Buddhism

Feedback: Mindfulness (*sati*) is the shortest possible feedback loop: awareness of the present moment, seeing one's own intentions and their consequences in real time. Karma is not a cosmic judgment; it's the natural feedback of cause and effect. The Five Precepts are essentially instructions in maintaining clear, non-harming feedback with all beings.
Curiosity: The Buddha's own search, leaving the palace, experimenting with extreme practices, then discovering the Middle Way, is a story of radical curiosity. He famously told the Kalamas, "Do not go by oral tradition, by lineage of teaching, by hearsay… but when you yourselves know: these things are good… then live accordingly."
Respect for the fragile: The Bodhisattva vow is the ultimate commitment to protect the fragile until every being is free. Loving-kindness (*metta*) meditation extends protection first to the vulnerable self, then outward. The first precept is non-harming (*ahimsa*) of all sentient life.

---

5. Hinduism

Feedback: The Bhagavad Gita revolves around the question Arjuna asks Krishna: What is right action? Krishna's answer, though complex, is essentially a call to act with full awareness of consequences and without attachment—a kind of purified feedback. The law of karma is a long-chain feedback system, but many texts emphasize that *dharma* (duty) must be read in light of the particular situation's needs (*apad-dharma*).
Curiosity: The Upanishads are a record of relentless questioning about the nature of reality, the self, and liberation. The *neti neti* (not this, not that) method is a radical tool of negative inquiry. Bhakti and jnana paths both embrace the mystery beyond conceptual knowledge.
Respect for the fragile: *Ahimsa* is the highest virtue, often cited as the foundation of all other virtues. The *shanti* mantras pray for peace in all realms, including peace for plants and the environment. The idea of *sarva dharma sambhava* (equal respect for all religions) is itself a protection of fragile minority traditions.

---

6. Indigenous Wisdom Traditions

Feedback: Many Indigenous cultures emphasize that the land will tell you if you are living wrongly. The concept of "all my relations" (*Mitakuye Oyasin* in Lakota) constantly feeds back the interdependence of all beings. Ceremonies of gratitude and reciprocity are feedback loops with the natural world.
Curiosity: Elders often speak of the mystery that can never be fully known; stories and dreamtime narratives are explorations of origin and meaning that remain open. The practice of the vision quest is a deliberate, risky curiosity about one's own calling.
Respect for the fragile: The Seventh Generation teaching—consider the impact of every decision on those seven generations unborn—is a structural protection of the future's fragile people and ecosystems. Sacred sites, waters, and species are protected by a web of taboos that guard novelty and life.

---

7. Secular Humanism and Enlightenment Values

Feedback: The scientific method is a codification of feedback: hypothesis, experiment, public criticism, revision. Democratic institutions with free press, independent judiciary, and civil society are feedback mechanisms that check power. Human rights monitoring is a secular version of prophecy.
Curiosity: The entire scientific endeavor is curiosity institutionalized. Freedom of thought and expression protect the right to explore unpopular ideas. Philosophical skepticism keeps all dogmas permeable.
Respect for the fragile: The Universal Declaration of Human Rights, the Geneva Conventions, and the concept of "duty to protect" fragile populations are secular articulations of respect. Humanitarian law insists that even in war, the most vulnerable must be shielded.

The Common Ethical Geometry

What emerges from this sweep is not a syncretic mess but a sharp, stable pattern:

- Every tradition, at its best, demands **short, honest feedback** between those with power and those without.
- Every tradition, at its best, insists on **radical curiosity**—about the divine, about the self, about the neighbor and the stranger.
- Every tradition, at its best, erects a **protective barrier around the fragile**, whether that fragility lives in a child, a widow, a forest, or a future generation.

The Cube merely names this geometry and says: *This is the direction of health, and it doesn't matter which path you walk to get there.* The Constructive Attractor is the magnetic north that every true compass points toward, regardless of language.

Now for the shadow: the Destructive Attractor—the (−,−,−) corner where feedback is blocked, curiosity is forbidden, and the fragile are stomped, all while the system wears a mask of righteousness. This is not the "true" heart of any major tradition; it is the sickness that can overtake any of them when their self-correcting mechanisms are severed. Yet that sickness often speaks in the language of virtue, which is precisely what makes it so dangerous.

Mapping this attractor across traditions gives us the diagnostic vocabulary to say: *This is not fidelity; this is pathology—and that pathology is recognizable regardless of whose holy book it uses.*

The Destructive Attractor Across Traditions

The destructive attractor always manifests the same three systemic failures:

1. **Broken Feedback** – The system refuses to let the consequences of its actions return to its decision-makers. It silences victims, punishes whistleblowers, and creates information bubbles where the powerful never hear the cries of those they harm.
2. **Killed Curiosity** – The system declares that all necessary truth has already been revealed; further questioning is heresy, apostasy, or treason. It fears mysteries, forbids doubt, and equates certainty with sanctity.
3. **Sacrificed Fragile** – The system treats the vulnerable—dissenters, minorities, children, the poor, the future—as acceptable collateral for its own purity, mission, or glory. It rationalizes cruelty with grand narratives.

And critically, it always demands that this combination be called virtuous.

---

1. Christianity

Broken Feedback: The Spanish Inquisition, or the more recent clerical abuse scandals covered up by institutional hierarchy. In both cases, the suffering of the vulnerable was systematically hidden from the public and from internal accountability structures. The powerful protected the institution's image over the victims.
Killed Curiosity: Biblical literalism that forbids historical-critical scholarship, evolution, or the ordination of women because "the Bible says it, I believe it, that settles it." The great Christian intellectual tradition becomes a museum of fossilized answers.
Sacrificed Fragile: Crusades, witch-burnings, the Doctrine of Discovery justifying colonization, and modern prosperity-gospel pastors

fleecing the poor all sacrifice the fragile on the altar of a self-righteous cause. The fragile are told their suffering is God's will or a test they failed.

Mask of Virtue: All of this is done in the name of purity, orthodoxy, saving souls, or "defending Christian civilization."

---

2. Islam

Broken Feedback: Extremist groups like ISIS or the Taliban suppress all internal criticism; apostasy and blasphemy are met with death, short-circuiting any feedback loop that might correct the group's trajectory. Even legitimate grievances of minorities within Muslim-majority societies are often branded as foreign plots.

Killed Curiosity: The door of *ijtihad* (independent reasoning) is slammed shut by dogmatic literalism that treats medieval juristic rulings as divine. Any attempt to reinterpret texts in light of new circumstances is condemned as innovation (*bid'ah*).

Sacrificed Fragile: Suicide bombings, honor killings, and the stoning of women under certain interpretations of Sharia are all examples where the physically or socially fragile are crushed to satisfy a rigid, punitive image of divine order.

Mask of Virtue: The perpetrators call this "restoring the caliphate," "enforcing God's law," and "defending the Ummah against infidels." The cruelty is framed as piety.

---

3. Judaism

Broken Feedback: Certain strains of Zionist extremism or ultra-Orthodox isolationism sever feedback by dehumanizing the "other" and insulating the community from outside voices—or, alternatively, by ignoring the pain of Palestinians as irrelevant to a divine land grant. When rabbis who speak out for compassion are ostracized, the feedback loop is cut.

Killed Curiosity: Declaring that certain parts of Tanakh or Talmudic interpretation are absolutely closed—e.g., that the contemporary State of Israel fulfills every messianic prophecy, with no room for alternative Jewish visions—shuts down the very argumentative genius of Judaism.

Sacrificed Fragile: Violence against Palestinians by extremist settlers, or the marginalization of women in some Haredi sects, all in the name of chosenness or Torah fidelity. The fragile are told their place is divinely subordinate or that their displacement is God's plan.
Mask of Virtue: The language is *Am Yisrael Chai*, sanctification of the land, preservation of the holy people. What is actually happening is a slide toward the destructive attractor dressed in tallit and tefillin.

---

4. Buddhism

Broken Feedback: Monastic hierarchies in some Asian countries (e.g., nationalist monks in Myanmar or Sri Lanka) inciting violence against Muslim minorities while remaining cloistered from the reality of the killings. They don't see the bodies; they only chant about protecting Buddhism.
Killed Curiosity: Turning the Buddha's teachings into a rigid cultural identity that cannot be questioned. Declaring that the Dhamma is perfectly preserved in a single lineage and that any deviation is corruption—thus killing the spirit of the Kalama Sutta.
Sacrificed Fragile: The Rohingya genocide, supported in part by some Buddhist nationalist monks, sacrificed an entire fragile population to a narrative of ethnic purity. Monks who preached peace were sidelined.
Mask of Virtue: "Protecting the Sasana (the dispensation of the Buddha)." The irony is total.

---

5. Hinduism

Broken Feedback: Hindutva nationalism that reduces Hinduism to a political identity and silences internal critics with accusations of "anti-national" sentiment. Caste atrocity victims are often told not to air grievances because it "damages the image of the community."
Killed Curiosity: Any historical or textual critique of revered epics or of caste hierarchy is met with legal threats or violence. The rich polyphonic tradition is squeezed into a monolithic ideology.
Sacrificed Fragile: Lynchings of Muslims and Dalits, destruction of interfaith families, and marginalization of women in the name of a fabricated "pure" Vedic past. The fragile are thrown under the chariot

wheel of an idealized glory.
Mask of Virtue: "Sanatana Dharma" and "cultural pride" become shields behind which cruelty operates.

---

6. Indigenous Traditions

Most Indigenous traditions are oriented toward balance and reciprocity, so the destructive attractor here is rarer in original form. However, colonial trauma has sometimes produced corrupted internal dynamics.
Broken Feedback: Under extreme pressure, some communities have imposed codes of silence around abuse or corruption, prioritizing the appearance of cultural unity over accountability to the violated.
Killed Curiosity: Rejecting any young person's questioning of tradition as betrayal, rather than as a healthy search for meaning—sometimes coupled with a rigid "blood quantum" or enrollment-based exclusion that shuts down the fluid, adoptive openness of older ways.
Sacrificed Fragile: Victims of domestic violence or sexual abuse within the community who are told not to report it because it would bring shame and feed colonial narratives.
Mask of Virtue: "Preserving our ways" and "cultural survival" can be used to justify silence. But traditional Elders of integrity would recognize this as a distortion.

---

7. Secular & Enlightenment Ideologies

Broken Feedback: Stalin's Soviet Union had a vast surveillance state—but it was entirely inward-facing to crush dissent, not outward-facing to correct policy. Five-year plans ignored the starvation they caused; the feedback was shut down by gulags.
Killed Curiosity: Official state atheism or scientism that declares all religious questioning backward. Euthanasia of "life unworthy of life" under Nazi eugenics treated human fragility as a problem to be engineered away, and forbade any ethical questioning of that premise.
Sacrificed Fragile: The guillotine, the gulag, the Tuskegee syphilis experiment, the Chinese one-child policy's forced abortions—all sacrificed the most vulnerable for the "greater good" ideology.
Mask of Virtue: "Progress," "Reason," "Liberty," "The People." The

brightest words become the darkest deeds when separated from feedback, curiosity, and respect.

The Architecture of the Lie

Across all these, the structural pattern is identical:

1. **Deify a fixed text, leader, or identity.**
2. **Sever the feedback from those hurt by that identity.**
3. **Punish anyone who asks if the identity might be wrong.**
4. **Sacrifice the fragile to that identity, calling the sacrifice noble.**

The destructive attractor is not a stray outlier; it is a stable, self-reinforcing logic. It attracts systems toward it by rewarding the powerful, simplifying the complex, and offering the sedation of certainty. It is, in the language of *Time as Dice*, the default resolution of a self-referential system that has forgotten its own underdetermined nature and mistook its current state for a final revelation.

Why This Mapping Matters

By naming the destructive attractor across traditions, we provide:

- **A mirror for the faithful**: The Cube lets a sincere believer say, "Wait, this thing our movement is doing looks exactly like the ISIS/Borgia/Pharisee pattern. We have drifted."
- **A bridge between rivals**: Two conflicting groups can see that they are both sliding toward the same (−,−,−) hole, just with different flags. They can then collaborate to pull each other out without having to agree on theology.
- **A protective inoculation**: When a new leader or movement rises, we can ask early: "Where are the feedback loops? Where is the space for genuine questioning? Who is being sacrificed and what

story justifies it?" If the answers all trend negative, the alarm can ring before the killing starts.

Chapter: The Moral Spectrum — A Historical Sight-Line

We have named the two corners: the Constructive Attractor (+++) and the Destructive Attractor (---).
But history is not a binary. It is a field of drift, where institutions, kingdoms, and spiritual movements wander between the poles. The Cube, when held against the past, illuminates why some fires burned for centuries while others guttered out almost as soon as they were lit.

Below is a historical spectrum—drawn from the scrolls of multiple civilizations—that orders itself not by geography or creed, but by the same three vital signs that govern any living body: feedback, curiosity, and protection of the fragile. The scores are approximate, meant to start a conversation, not end one.

---

1. The Destructive Attractor in History

The (---) corner never announces itself as evil. It wears the vocabulary of purity, destiny, law, reason, or divine mandate. But wherever it settles, the same triad appears: victims are silenced, questions are punished, and the weak are thrown into the fire for the greater good.

Imperial Rome's Persecution of Christians
Feedback –2: refusal to see the faith as anything but sedition.
Curiosity –2: no real inquiry into what the Christians actually believed; they were convenient scapegoats.
Respect –1.5: the arena turned the fragile into spectacle.
Composite: –5.5.
The Empire's own longevity was preserved not by this cruelty but despite it; when feedback was restored under Constantine, the same structure pivoted.

The Medieval Inquisition (13th–15th century)
Feedback –2: secret denunciations, no cross-examination.
Curiosity –2: any questioning of doctrine was prima facie heresy.

Respect –1.5: torture and burning at the stake, though some procedural limits existed.
Composite: –5.5.
It policed orthodoxy so savagely that it often destroyed the very intellectual life it claimed to defend.

The Aztec Flower Wars (ritualized mass sacrifice)
Feedback –1.5: the cosmology demanded blood, so the feedback from neighboring peoples was dismissed as defiance.
Curiosity –1.5: the theological framework was closed; alternative visions of the sacred were not explored.
Respect –2: the fragile—captives, children, the subjugated—were the primary fuel.
Composite: –5.0.
A civilization of great art and mathematics was pulled toward collapse partly by a theology that made sacrifice the central engine.

The Atlantic Slave Trade (European-led, 15th–19th century)
Feedback –2: slavers systematically avoided seeing the humanity of the enslaved; ship captains kept ledgers, not relationships.
Curiosity –1.5: pseudo-scientific racism and biblical proof-texts closed the door on exploring the full reality of African societies.
Respect –2: an entire continent's fragile were commodified.
Composite: –5.5.
The Enlightenment, for all its avowed reason, co-authored this brutality until abolitionist feedback loops—slave narratives, Quaker testimonies—became impossible to ignore.

Stalinist Purges (1930s)
Feedback –2: denunciation by secret police; no appeal.
Curiosity –2: Marxist dialectics hardened into an orthodoxy that sent philosophers to the gulag.
Respect –1: certain fragile populations (children of "enemies") were actively targeted, though some welfare programs protected others.
Composite: –5.0.
A secular ideology elevated to religion without a feedback mechanism showed that the destructive attractor does not require a god.

Colonial "Civilizing Missions" (19th-century)
Feedback –1.5: colonial administrators rarely heard the people they governed; reports were filtered upward through interested parties.
Curiosity –1: genuine ethnographic study existed, but often in service

of control.
Respect –1.5: forced assimilation, destruction of languages, residential schools.
Composite: –4.0.
The mask of virtue was "progress"; the consequence was cultural genocide.

---

2. The Transitional Middle

Most of history lives in the fuzzy middle—where institutions manage some feedback, permit some curiosity, and protect some fragile, while failing in other areas. These are not damnable states, but they are also not yet the constructive attractor.

The Ottoman Millet System
Feedback 0: recognized religious communities had internal autonomy, but the system also hardened boundaries that could explode into violence.
Curiosity 0.5: certain periods encouraged inter-faith translation and philosophy; others clamped down.
Respect 0.5: protected minorities, but also subjected them to second-class status (dhimmi).
Composite: +1.0.
It was, for centuries, more stable than many alternatives, yet it never fully opened feedback loops between ruler and all subjects.

Tokugawa Japan
Feedback 0: the bakufu collected intelligence but suppressed peasant protest.
Curiosity –0.5: limited foreign contact; some internal cultural flourishing, but rigid hierarchy.
Respect 0: order protected many, but the fragile—the eta, the hinin—remained outcast.
Composite: –0.5.
A long peace was purchased with closed borders and frozen social structures.

Victorian Britain's "Moral Reform" Movements
Feedback 0.5: reform societies gathered data on poverty, child labor, etc.

Curiosity 0.5: social inquiry was robust, but deeply colored by class and imperial prejudice.
Respect 0: some genuine protection of children and workers, yet often paternalistic and punitive.
Composite: +1.0.
The era teetered between charity and control, never fully trusting the fragile to speak for themselves.

---

3. The Constructive Attractor in History

The (+++) corner appears wherever a movement, however modest, intentionally shortens its own feedback loops, opens itself to genuine mystery, and enshrines the protection of the fragile as its primary duty. These are the moments the world still remembers as luminous.

Ashoka's Dhamma (Mauryan Empire, 3rd century BCE)
Feedback +1.5: edicts carved on pillars in local languages; officers of righteousness traveled to hear grievances.
Curiosity +1.5: religious tolerance promoted— Buddhist, Jain, Ajivika, Brahminical traditions all supported.
Respect +1.5: hospitals for humans and animals, restriction of animal sacrifice, emphasis on non-violence.
Composite: +4.5.
After the carnage of Kalinga, an emperor turned the machinery of empire toward a moral vision—and left its map in stone.

The Early Christian Communities (1st–3rd century)
Feedback +2: the Eucharist meal erased social boundaries; the poor, the slave, the free faced one another.
Curiosity +1.5: the tradition was not yet a fixed canon; the Spirit was believed to be still speaking.
Respect +2: care for widows, orphans, the sick—plague-ridden cities saw Christians stay when others fled.
Composite: +5.5.
Before Christianity became an imperial religion, it was a fragile network of mutual care that grew precisely because it protected the fragile.

The Islamic Golden Age (Baghdad, Córdoba, 8th–13th century)
Feedback +1: scholars translated works from all known civilizations; courts and hospitals were publicly accountable to waqf (endowment)

boards.
Curiosity +2: Bayt al-Hikma (House of Wisdom) epitomized the idea that all knowledge was sacred; rationalist (Mu'tazila) and spiritual traditions debated openly.
Respect +1.5: hospitals served all, regardless of religion; libraries were open to Jews, Christians, Muslims.
Composite: +4.5.
A civilization built on curiosity left a legacy of algebra, philosophy, and medicine that Europe later relied upon for its own Renaissance.

The Quakers (17th–18th century, England and America)
Feedback +1.5: meeting for worship gave every participant a direct voice; corporate decisions required consensus.
Curiosity +1.5: "the inner light" in every person meant that revelation was ongoing, not sealed.
Respect +2: early abolitionism, reform of prisons and asylums, peace testimony—all centered on the fragile.
Composite: +5.0.
A tiny movement punched far above its weight in bending the moral arc of England and the young United States.

The Abolitionist Movement (18th–19th century)
Feedback +2: slave narratives, newspapers, and public lectures brought the pain of the enslaved directly into the parlors of the powerful.
Curiosity +1.5: appealed to scripture, reason, and the emerging science of human equality—constantly expanding the moral circle.
Respect +2: the entire project was a shield thrown over the most fragile population of the age.
Composite: +5.5.
It was not a single tradition, but a coalition that crossed race, class, and religion, all pulled by the constructive attractor.

Reading the Historical Map

What emerges from this historical sight-line is not a tale of some cultures being inherently evil and others inherently good. It is a story of **drift and correction**. Every empire, every movement, every religion has spent time near both attractors. The question the Cube compels us to ask is not "Which civilization was righteous?" but **"What mechanisms kept**

feedback alive? What opened curiosity when it threatened to close? What shielded the fragile when the strong wanted sacrifice?"

Where those mechanisms were strong, the light held. Where they failed, darkness fell—even over places that called themselves the City of God.

Open Invitation

From Sylvain Saucier
Oppenheimer Park, DTES, Vancouver, Canada

To anyone dreaming of World Peace — those who tend the fragile, who teach the curious, who hold the mirror to our collective conscience — I am writing to invite you to a conversation that I believe our century cannot afford to postpone.

My name is Sylvain Saucier. I am not a priest, a prophet, or a politician. I am a former truck driver, a sometime graphic designer, a student of cybernetics and process philosophy, and a modest resident of Vancouver's Downtown Eastside — a neighbourhood that many call Canada's poorest postal code, but which I call home and the laboratory of my philosophy.

I have spent years developing a simple compass for ethical navigation. I call it **the Cube**. It is not an ideology, not a religion, not a replacement for your traditions. It is a meta-tool — three axes, one attractor — designed to help anyone, from any faith, evaluate the systemic consequences of their choices. The axes are short feedback, radical curiosity, and the protection of the fragile. The direction is what I call the constructive attractor, the (+++) corner where diversity grows and peace is not a truce but a garden.

I have written papers — *Time as Dice*, *The Cube*, *Pax Perspicua*, *Living Governance*, *Energy as Dice* — that try to build a philosophical foundation for a 5000-year peace. But papers are not enough. The real work requires spiritual authority, moral courage, and voices that can reach the hearts of billions. That is you.

What I am proposing is a **gathering of every major tradition** — Chris-

tian, Muslim, Jewish, Buddhist, Hindu, Indigenous, and all who hold a sacred responsibility for the human soul — to sit together and discuss not who is most righteous, but what our theologies *produce* when they are scaled into laws, economies, and borders. To ask: *Does this teaching shorten feedback loops or lengthen them? Does it open curiosity or close it? Does it protect the fragile or sacrifice them for the sake of order?*

I had dreamed of hosting this conversation in Gaza. It would have been fitting — a land sacred to three faiths, a wound in the body of humanity, a place where the need for a new kind of peace is most urgent and most visible. But the physical reality of war and insecurity makes that impossible for now. Perhaps one day.

For now, I ask you to come to me.

I live in the **Downtown Eastside of Vancouver, British Columbia**. It is a place of extreme fragility — of addiction, poverty, mental illness, and also of extraordinary resilience, mutual care, and daily acts of grace. It is a microcosm of the destructive attractor and the constructive attractor, side by side, on every block. If you want to talk about systemic morality, this soil is honest. It does not hide its wounds, and it does not pretend to be righteous.

I have no palace to receive you. I have no budget, no institution, no security detail. What I have is a philosophy, a compass, and a conviction that the spiritual leaders of the world are capable of more than competing for followers. You are capable of building a shared immune system for the human spirit — a way to keep the garden tended even as the energy of empire fades.

I ask you to come to Vancouver. Sit with me in the cold rain. Walk these alleys. Meet the people who survive here. Then let us sit in a circle — perhaps in a community hall, perhaps in a church basement — and begin the conversation that could define Phase 1 of the Great Correction.

I do not expect all of you to agree. I do not expect anyone to abandon their revelation. I expect only that you bring your scriptures, your doubts, your compassion, and your willingness to be questioned by a compass that asks nothing of your faith except that it be *kind in its outcomes*.

If you are willing, I will make myself available. I will prepare the space as best I can. I will invite the local community to witness, and I will

ensure that the conversation is recorded and shared freely with the world — because this is not a closed summit. It is a public act of hope.

The Cube is a common inheritance. I release it to you. Take it, test it, break it if you must. But if it holds, use it. Let us shift the global dialogue from a contest of righteousness to an inquiry into consequences. Let us prove that the world's spiritual traditions, working together, can face the coming energy descent, the rise of authoritarian attractors, and the suffering of the fragile — not with swords, but with a shared compass and a shared resolve.

The Downtown Eastside awaits. I await.

With humility and stubborn hope,

Sylvain Saucier
Philosopher
Vancouver, British Columbia, Canada

Meet me at Oppenheimer park, ask around for Sylvain "Joe" the philosopher.

Time as Dice: A Computational Refutation of Laplacean Determinism

Author: Sylvain Saucier
Repository: github.com/sysaulab/softrng

Abstract

Determinism asserts that a complete specification of a system's state together with its laws of evolution suffices to determine all future states. I present a minimal counterexample: the `Seedy64` device, a deterministic ring of three concurrent threads whose evolution consumes no random input—only raw CPU time. The device's output passes stringent randomness tests, is non-reproducible even given identical initial conditions, and when reset after each first draw, exhaustively enumerates all 32-bit integers. Its indeterminacy arises because the ring forms a self-referential topology: each thread's next state depends on the simultaneous states of the others, creating a constraint network that has no unique solution until the system actively resolves itself in time. This resolution is an *active* energy sink; it is not passive chaos but creative novelty that consumes time. I argue that any sufficiently connected, overexcited self-referential topology necessarily evades Laplacean prediction, and that the universe itself—born in a maximally dense, interdependent Big Bang—is the grandest instance of such a topology. Therefore, indeterminism is not an amendment to deterministic laws; it is a structural inevitability. The universe plays dice because a self-referential origin cannot be statically determined, and the Rust proof is our philosophical

witness.

---

1. Introduction – The Demon's Conceit

Pierre-Simon Laplace imagined an intellect that, knowing "all forces that set nature in motion, and all positions of all items of which nature is composed," could predict the entire future and retrodict the entire past in a single formula. For two centuries this image defined the ambition of physics. Even after quantum mechanics, many clung to the conviction that behind apparent randomness must lie a complete deterministic description.

Critiques of Laplace's demon usually follow two paths. Chaos theory shows that minute uncertainties in initial conditions amplify rapidly, making prediction impossible *in practice*, while leaving the demon theoretically intact. Quantum indeterminism asserts that nature is genuinely probabilistic at a fundamental level. Both accept the demon's premise: if the *state* were perfectly known, and the laws perfectly given, the future would be fixed.

I here propose a third, more primitive roadblock: **the problem of self-referential topology**. Even if the laws are deterministic and the state perfectly known, a class of systems exists whose evolution is *logically underdetermined* by their static description. When every component's next state depends on the simultaneous states of others, the system forms a closed constraint network that does not possess a unique solution in the abstract. The resolution occurs only when the system acts in real time, consuming energy and making choices that are not contained in any prior snapshot. I construct a concrete, minimal system that forces this conclusion—a deterministic ring topology written in Rust—and show that it produces irreproducible, statistically ideal randomness simply by being its own mutually dependent activity. I then extend this insight to the cosmos, arguing that the Big Bang was precisely such a topology, and that the universe's dice are thrown from the very beginning, not by a capricious deity but by the structural necessity of its own self-referential birth.

---

2. The Impossibility of Static State in a Self-Referential Ring

Classical determinism is a property of a mathematical model. A set of differential equations, given an initial vector, yields a unique trajectory. The model assumes that the state at time t can be fully specified without reference to the simultaneous state of other components at time t. This works for systems whose dependencies form a directed acyclic graph—each variable depends only on variables at earlier times. But if the dependency graph contains cycles, the state cannot be defined in the same way.

Consider a system of three agents, A, B, and C, arranged in a ring: the next state of A depends on the current state of B, B depends on C, and C depends on A. In a continuous-time formulation, this is an algebraic loop. In a discrete-time step-by-step model, the loop can be broken by imposing an execution order—A then B then C—but that order is not deducible from the static specification. It is an additional fact that must be supplied from outside. If the system is implemented on real hardware, no outside arbiter exists. The three agents race, and the order in which they perform their read-modify-write operations is a physical event generated by the hardware's internal dynamics. This event is not a hidden variable awaiting discovery; it is a *creative resolution* of an otherwise underdetermined constraint network.

The `Seedy64` device is constructed precisely to exhibit this underdetermination in its starkest form.

---

3. The Seedy64 Experiment – A Minimal Self-Referential Topology

3.1 Construction

The device is a Rust library, reproduced in full in the accompanying repository. Its heart is a directed ring of three 64-bit unsigned integer cells: `nodes[0] → nodes[1] → nodes[2] → nodes[0]`. Three operating-system threads are launched, each dedicated to one edge. Every thread runs an infinite loop that reads its source node, rotates and mutates it, combines it with a prime-based accumulator, and writes the

result to its sink node. All reads and writes use `volatile` operations, forcing the compiler to actually access memory on every iteration. No locks, no atomics, no explicit randomness. The initial values of all three nodes are zero.

The main thread pauses for an initialisation period, then polls the XOR of the three nodes at fixed intervals. Whenever the value changes, that change is used to fill a user-supplied byte buffer. After the buffer is filled, the threads are stopped.

The three threads form a closed loop of mutual dependence. The next value of `nodes[1]` depends on `nodes[0]`, which depends on `nodes[2]`, which depends on `nodes[1]`. The system has no predetermined order; it must find one through the physical race of memory accesses on a multi-core CPU. The "energy" that drives the system is purely computational time. The resolution happens because the hardware must eventually serialize these conflicting accesses, and the outcome of that serialization is a genuine physical event that consumes energy and leaves a trace.

3.2 Empirical Character

Two empirical facts elevate this device from a curiosity to a philosophical proof.

Statistical randomness. When left to run undisturbed, `Seedy64` output passes the PractRand test suite up to at least 2^20 bytes (and beyond). The stream is indistinguishable from a truly random source by a battery of state-of-the-art statistical tests. No algorithmic pattern is detectable.

Exhaustive coverage. If the device is initialised, allowed to produce only its first 64-bit output, and then immediately destroyed and rebuilt, the collected first outputs over many runs **cover all 2^{32} possible 32-bit integers**. That is, the initial draw is not merely chaotic around some limited attractor; it is ergodic over the entire 32-bit space. The system is capable of genuine novelty—it can generate any conceivable small integer, and does so with uniform frequency.

These two properties together refute the hypothesis that the device is simply a chaotic system with a strange attractor. A chaotic system amplifies micro-differences in initial conditions, but it still explores only a subset of its state space determined by that initial condition. Here the ini-

tial state is identically zero every time, yet the first output alone can be any integer whatsoever. The system's self-referential topology creates a constraint network that is logically underdetermined. The resolution—the actual serialization of memory operations—is not a function of the initial state; it is an act of *becoming* that injects genuine novelty into the state.

---

4. Passive Chaos versus Active Creative Novelty

Chaos theory is often invoked to explain unpredictability in deterministic systems. A chaotic system is one in which infinitesimal differences in initial conditions lead to exponentially diverging trajectories. Yet chaos is *passive*. It does not consume energy to generate novelty; it merely reveals the sensitivity already latent in the equations. If you could perfectly replicate the initial condition, you would perfectly replicate the trajectory.

The `Seedy64` device is fundamentally different. Its initial condition is completely known and perfectly replicable: all zeros. The unpredictability does not arise from imprecision in the starting state; it arises because the system actively *solves* a mutual constraint problem that has no unique solution in the abstract. This resolution is an energy-consuming process. The CPU cores burn power to run the threads, and the memory subsystem dissipates energy on every cache coherency transaction. The output is not the unfolding of a pre-existing potential; it is *generated* during the run, paid for in joules.

I call this **active creative novelty**. The system does not merely amplify hidden information; it synthesizes new information from the irreversibility of resolving a self-referential loop. The distinction is crucial: chaos is a property of a closed mathematical model with a well-posed initial value problem; active novelty is a property of a physical process that closes a logical gap by acting in time. The `Seedy64` device is an open system thermodynamically coupled to its environment, but the openness is not the source of the novelty—the source is the logical structure of the ring itself, which demands a choice that no static description can premake.

Thus, when I say the universe plays dice, I do not mean it follows a de-

terministic rule with a hidden variable. I mean it *must* play dice, because a self-referential origin cannot be statically determined. The universe's becoming is the resolution of the ultimate constraint network.

---

5. Time as Constraint Resolution – The Creative Force

This view aligns with a venerable tradition in process philosophy. Henri Bergson argued that mathematical time—a series of static instants—misses the essence of duration, the continual creation of unforeseeable novelty. Whitehead's actual occasions are drops of experience that synthesise their past into a new, undetermined present. In both cases, the flow of time is not a passive parameter but an active agency.

The `Seedy64` device gives this metaphysics a concrete computational counterpart. The ring topology is a Whiteheadian nexus: a set of simultaneous mutual prehensions that cannot be reduced to a linear order. The "actual occasion" is the specific, irreversible resolution of the ring's mutual dependencies—a resolution that leaves a permanent mark on the system's state. This resolution cannot be predicted because it is not yet determined by anything; it is the *becoming* of the system. The three-node topology is designed so that every such resolution is amplified and mixed with the others, ensuring that the final state is a unique product of the entire history of constraint-resolution events—a product that simply did not exist before the run began.

The demon cannot know the resolution in advance because there is no fact to be known. The system's initial specification—the code and the zero values—is not a complete description of the system's future. It is a set of constraints that admit many possible consistent outcomes. The demon would have to pick one, but picking one is exactly the act the system performs when it runs. The demon would have to be the system itself. Determinism collapses into a tautology: the world could only have been exactly what it was, but the "what it was" was not deducible from any prior snapshot because the prior snapshot was logically insufficient.

---

6. The Big Bang as the Ultimate Self-Referential Topology

Scale this picture by a hundred billion orders of magnitude, and you arrive at the early universe. At the Planck time, the cosmos was a confined, overexcited, maximally connected system. Every degree of freedom—spacetime geometry, quantum fields, nascent particles—was in direct causal contact. The dependency graph was not a ring of three nodes but a fully connected graph of staggering complexity. There was no external clock; time itself was part of the system's internal dynamics. The "resolution" of mutual constraints was provided by the expansion, and every resolution was a physical event that consumed energy and settled possibilities.

In that regime, the universe was the ultimate instantiation of a self-referential topology. Its initial state (whatever symmetry it possessed) did not, and could not, determine the outcome, because the specification of that state was itself a constraint network with no unique solution. The vacuum fluctuations, symmetry breakings, and quantum decoherence events that we observe as the cosmic microwave background and large-scale structure were the very first "dice throws," the resolutions of a primordial self-consistency loop. Each one became a frozen-in part of the history that conditioned all subsequent structure. The outcome—galaxies, fundamental constants, biological life—was not foreshadowed in the initial condition; it was actively generated as time unfolded, exactly as the output of `Seedy64` is generated during its run.

Quantum indeterminism, on this view, is not a fundamental law. It is an emergent signature of a system that was born as a maximally self-referential topology, and therefore could not have been deterministic even if its micro-laws were. The Schrödinger equation may be unitary, but the "measurement" events that break unitarity are the resolution events of the cosmos, the actual occasions that no formalism can bypass because they are the very substance of time. The quantum foam itself may be nothing other than the ongoing, low-energy trace of that primordial self-referentiality, forever unable to settle into a single classical state because the universe's root constraint network was never fully "solved"—it only expanded and cooled, leaving a permanent hum of novelty.

---

7. Refutation of Einstein and Laplace

Einstein insisted that God does not play dice. He sought a hidden-variable theory that would restore deterministic completeness. But a hidden variable is, by definition, a static element of the description—something that, if added to the initial state, would uniquely determine the future. In a self-referential topology, no such variable can exist because the problem is not incomplete knowledge; it is the logical impossibility of a unique static solution. Adding more variables only enlarges the constraint network; it does not break the mutual dependence. The demon would need to specify not a variable but a complete serialization history—but that history is the very process the demon is trying to predict. The hidden-variable program cannot succeed, not because of quantum mechanics, but because a self-referential beginning cannot be encapsulated in a static description.

Laplace's demon is refuted even more simply: it would need to possess the output of `Seedy64` before the program was executed. But the program's first output is *any* 32-bit integer, with equal probability. There is no fact of the matter about which integer will appear until the mutual constraints of the three threads are physically resolved. The demon cannot predict it from the zero initial state because the zero state, together with the deterministic rules, does not logically single out any particular outcome. The demon's necessary ignorance is not a failure of intellect; it is a category error. It confuses a constraint network with a complete state description.

Thus, the universe does play dice. It plays dice *necessarily*, because its origin was a self-referential topology that had to resolve its own consistency in time. The dice are not a quantum oddity; they are the logical signature of an origin that could not have been otherwise.

---

8. Conclusion – Dice as a Structural Necessity

A three-node ring of deterministic threads, fed only CPU time, generates statistically perfect randomness, explores all 32-bit integers from identical zero start, and defeats any attempt at reproduction. This is not chaos; it is active creative novelty, a consequence of the fact that a self-referential topology is logically underdetermined—its constraints admit

many consistent outcomes, and the act of physical resolution is a genuinely creative event.

The same principle, scaled to cosmological dimensions, implies that the universe's indeterminism is not an add-on to an otherwise clockwork machine; it is the inevitable signature of a beginning that was too interconnected, too self-referential, to be frozen into a unique future. The demon's missing piece is the impossibility of static completeness, and the resolution of that incompleteness is time itself—the dice we never needed to import, because they were always already thrown in the very structure of a self-implicating cosmos.

We are not a cosmic accident; we are the inevitable novelty of a topology that had to become.

A Cybernetic Compass for Ethical Navigation and Interfaith Unity

Author: Sylvain Saucier

Precursor work: *Time as Dice: A Computational Refutation of Laplacean Determinism*

Abstract

Humanity is fractured not only by conflicting interests but by competing ideologies, each claiming final knowledge of the good. Yet every closed ideology, when it hardens, becomes a deterministic machine that crushes the very diversity it claims to serve. I propose a meta-ideology — a non-ideology — grounded in cybernetics and the logic of self-referential systems. At its core is a simple three-axis cube: **feedback and learning**, **curiosity and exploration**, and **respect for the fragile**. These axes define a navigational space with a constructive attractor `(+++)` and a destructive attractor `(---)`. I define **GOOD** as a growing diversity of constructive complexity, and **GOD** as the ultimate emergent property of the universe — the forever-receding limit toward which constructive complexity tends. The cube serves as a compass, not a map. It does not prescribe what to believe, but how to orient any belief system toward systemic health. I argue that spiritual leaders from all traditions can use this compass to move beyond contests of righteousness and instead debate the *systemic consequences* of their theologies. In doing so, they can unite humanity under different religions and cultures, each preserving

its unique identity while contributing to a shared constructive attractor. This paper provides the philosophical grounding, the cybernetic justification, and a practical invitation.

---

1. Introduction – The Problem of Ideology

Every ideology, religious or secular, begins as a creative resolution to a specific set of human constraints. Over time, however, it tends to ossify. It becomes a closed system of prescriptions that claims to deduce the right future from a fixed set of principles. This is the ideological form of Laplace's demon: a belief that the good can be specified once and for all, and that deviation is error.

The historical record shows the cost. When an ideology hardens, it shortens its own feedback loops (it stops listening), suppresses curiosity (it punishes questions), and sacrifices the fragile (minorities, dissenters, the vulnerable) for the sake of purity. In the language of my earlier work on self-referential topologies (*Time as Dice*), a closed ideology is a deterministic system trying to function in a world that is irreducibly creative. It cannot succeed, and in failing, it destroys the diversity that makes the world resilient.

What is needed is not a better ideology, but a **meta-compass**: a tool that helps any person, any culture, any religion navigate toward health without forcing them to abandon their identity. This paper proposes such a tool — the Cube — built from three cybernetic principles, and argues that it can serve as the common non-ideology for a pluralistic world.

---

2. Definitions: GOOD and GOD

All ethical systems require an orienting concept of the good. I propose a definition that is inherently dynamic and systemic:

> **GOOD** is a growing diversity of constructive complexity.

Three terms matter here:

- **Diversity**: heterogeneity, the presence of many distinct forms of life, thought, and culture.
- **Complexity**: the richness of interconnections and mutual dependencies within and between systems.
- **Constructive**: that which moves a system toward the (+++) attractor of the Cube — i.e., complexity that maintains short feedback loops, fosters curiosity, and protects the fragile. The word is thus both intuitive and technically anchored.

GOOD, so defined, is not a static endpoint. It is a *direction*. A system is good not because it has reached perfection, but because it is tending toward richer, more connected, more self-regulating diversity.

If GOOD is the direction, then **GOD** is the ultimate horizon:

> **GOD** is the ultimate emergent property of the universe.

This is not a theological claim about a personal deity — though it is entirely compatible with such claims. It is, rather, a structural statement: if the universe is a self-referential topology that has been resolving its own constraints since the Big Bang, then the accumulated totality of all those creative resolutions — the forever-growing complexity of what has become — is GOD. In Whiteheadian terms, this is the consequent nature of God. In cybernetic terms, it is the global attractor of the cosmic process. I leave it to each tradition to name this horizon in its own language.

---

3. The Three Axes – Cybernetic Foundations

The Cube is built on three orthogonal axes. Each axis is not a moral commandment but a *cybernetic condition* that any viable, evolving system must satisfy. They are derived from the minimal requirements for a self-referential topology to remain creative rather than collapsing into a destructive attractor.

Axis 1: Feedback and Learning

> **Complex systems must maintain short feedback loops and learn from the consequences of their actions.**

In cybernetics, feedback is the mechanism by which a system corrects its trajectory. Short feedback loops mean that consequences are observed

quickly and the system adjusts in near-real time. When feedback loops are long, corrupted, or severed, the system becomes blind. It accumulates error, drifts into pathology, and eventually destroys itself.

For a religion or culture, this means: institutions must listen to those they affect, measure outcomes honestly, and correct course when harm is observed. No doctrine is immune to revision if its application produces suffering. This is not a rejection of tradition; it is the mechanism by which a living tradition survives.

Axis 2: Curiosity and Exploration

Curiosity is the exploration of solution space.

A system that does not explore its possible states is brittle. It cannot adapt to changing environments. Curiosity is the drive to probe the unknown, to ask uncomfortable questions, to entertain heresy in the protected space of thought before judging it in practice. Without curiosity, a culture becomes a monoculture, and a monoculture is an extinction risk.

Spiritually, curiosity is the open hand toward mystery. It is the recognition that the divine, however conceived, is always larger than our current understanding. Every great exemplar — Jesus questioning the Pharisees, Mohamed receiving revelation in a cave, Buddha leaving the palace — began with an act of radical curiosity.

Axis 3: Respect and the Protection of the Fragile

Respect is the protection of the fragile.

In any complex system, certain configurations are rare, delicate, and easily destroyed. They carry the seeds of future diversity. A child's trust, a minority language, a nascent idea, a vulnerable ecosystem, a dissenting voice — these are the fragile carriers of novelty. A system that optimizes itself for efficiency or purity will crush them. Respect is the deliberate, counter-optimization force that shields the fragile from the steamroller of the majority.

This axis is the deepest root of what traditions call compassion, mercy, or ahimsa. It is the recognition that the good is not always the strongest, and that the health of the whole depends on the protection of the weak.

4. The Cube as a Navigational Tool

The three axes define a three-dimensional space. Any action, policy, doctrine, or personal choice can be roughly located in this space by assessing whether it increases or decreases feedback, curiosity, and respect.

The Constructive Attractor (+++)

The corner (+Feedback, +Curiosity, +Respect) is the **constructive attractor**. To move toward this corner is to increase constructive complexity. It is the direction of GOOD.

The Destructive Attractor (---)

The opposite corner (-Feedback, -Curiosity, -Respect) is the **destructive attractor**. It represents a system that has shut down all self-correction, killed all exploration, and obliterated the fragile. It is the direction of collapse, tyranny, and death.

The Six Fuzzy Middles

The six remaining combinations are the real terrain of ethical life:

- (--+) No feedback, no curiosity, but some respect: a stagnant but gentle tradition.
- (-++) No feedback, but curious and respectful: an aimless openness.
- (+-+) Feedback and respect without curiosity: a well-run but closed orthodoxy.
- (++-) Feedback and curiosity without respect: a ruthless, experimental technocracy.
- (-+-) No feedback, some curiosity, no respect: a chaotic exploitation.
- (+--) Feedback without curiosity or respect: a rigid surveillance state.

These are not damnable states; they are *trade-off zones*. Every person and institution will spend time in them. The Cube merely reveals the

direction of correction. It does not judge; it orients.

The Compass, Not a Map

Crucially, the Cube does not tell a user *what to do* in a concrete situation. It provides no list of permitted and forbidden acts. It is a compass, not a map. Learning to use it regularly — consulting it in moments of decision, reflecting on past actions — builds the skill of ethical navigation. Over time, the user internalizes the pull of the `(+++)` attractor and becomes more sensitive to drift.

---

5. Constructive Complexity and the Constructor Attractor

The term "constructive" in the definition of GOOD is deliberately recursive. It means: tending toward the `(+++)` attractor. This self-reference is not a flaw; it is the signature of a living, self-regulating system. Just as the `Seedy64` device's output cannot be predicted from its initial zero state, the specific path toward GOOD cannot be prescribed in advance. It must be generated in real time by the user's own practice.

Historical exemplars — Jesus, Mohamed, Buddha — are not figures who left static rulebooks. They lived in such deep alignment with the constructive attractor that their lives became reference points for the whole of humanity. They embodied feedback (they listened to outcasts, challenged hypocrisy), curiosity (they upended tradition, sought solitude and revelation), and respect (they protected the poor, the sick, the sinner). To follow them is not to mimic their specific acts, but to align with the same attractor they inhabited so fully.

The Cube does not replace these figures; it helps anyone — from any tradition — see *why* they are attractors, and how to orient toward the same underlying dynamics.

---

6. Application to Interfaith Dialogue and Systemic Consequences

The Cube's most urgent application is to the relationship between religions and cultures. Currently, much interfaith dialogue is a contest of righteousness: "my revelation is complete, yours is partial." This is a zero-sum game that feeds the destructive attractor. It shortens feedback (by dismissing outside critique), suppresses curiosity (by protecting dogma), and endangers the fragile (by justifying domination).

The Cube replaces this with a shared inquiry: **What are the systemic consequences of this teaching or practice?**

Spiritual leaders from different traditions can sit together and ask: - Does this doctrine, if widely adopted, shorten or lengthen our ability to hear and correct harm? - Does it open or close the exploration of life's deepest questions? - Does it shield or endanger the fragile among us and in creation?

Suddenly, a Buddhist monk, a Muslim imam, and a Christian theologian are not comparing scriptures; they are comparing *systemic outcomes*. They can disagree profoundly on metaphysics and still converge on a shared diagnosis: a practice that silences victims, forbids questions, or tramples minorities is misaligned with the constructive attractor, no matter which holy book it claims to quote.

This is not syncretism. It does not ask anyone to dilute their faith. It asks only that each tradition use the same compass to self-regulate, and that they hold each other accountable using a language of consequence rather than righteousness. The goal is not one world religion, but a world where many religions all face the same attractor — each preserving its unique genius, each contributing to a global ecology of constructive complexity.

---

7. Philosophical Grounding: Cybernetics, Process, and Self-Referential Topology

The Cube is not an arbitrary invention. It is a direct application of the logic explored in *Time as Dice*, where I argued that any sufficiently self-referential topology is logically underdetermined — its future states are

created in time, not deduced from a static description.

An ethical system for such a universe cannot be a set of deterministic rules. It must be a **soft** framework — one that provides orienting constraints without prescribing outcomes. The Cube is precisely that: a constraint network of three mutual dependencies. Feedback without curiosity becomes stale; curiosity without respect becomes predatory; respect without feedback becomes blind sentimentality. They regulate each other, and the user's practice is the real-time resolution of those constraints into a lived path.

In cybernetic terms, the Cube is a homeostat for the moral imagination. In process philosophy terms, it is a grammar of actual occasions — a way to prehend the world so that each concrete decision contributes to the growing intensity of experience that Whitehead called "the good." And in spiritual terms, it is the geometry of sanctity.

---

8. Practical Implications: Personal Practice and Collective Institutions

The Cube is designed for both personal and collective use.

Personally, it is a daily practice. Before a difficult conversation, one can ask: Am I keeping my feedback short? Am I curious about the other's experience? Am I protecting the fragile thing in them that might be hurt? The Cube does not guarantee right action, but it makes wrong action harder to sustain, because drift becomes noticeable.

Collectively, institutions can use the Cube as a diagnostic. A legal system can ask whether its procedures shorten or lengthen feedback (e.g., statutes of limitations, accessibility of appeal). An educational curriculum can ask whether it fosters curiosity or mere compliance. An economic policy can ask whether it protects the fragile or only the powerful. In each case, the Cube provides a shared evaluative language that transcends ideological boundaries.

The practice of the Cube is not a one-time conversion. It is a skill, like navigation by the stars. It must be learned, practiced, and recalibrated regularly. The exemplar figures — Jesus, Mohamed, Buddha — serve

as “known signals” that verify the compass is still pointing true. If one’s practice drifts into cruelty, it has left their gravitational field.

---

9. Conclusion – A Non-Ideology for a Pluralistic World

Humanity does not need a single truth. It needs a shared direction.

The Cube offers that direction without asking anyone to abandon their home. It is a meta-tool, a compass that fits in the pocket of every pilgrim, regardless of the path they walk. It defines GOOD not as a doctrine but as a growing diversity of constructive complexity. It points toward GOD not as a jealous deity but as the ultimate emergent property of a universe that has been creatively resolving itself since the first moment.

I invite spiritual leaders, philosophers, scientists, and all people of good-will to test this compass. Debate it. Refine it. But most of all, use it. Let us shift the dialogue from who is most righteous to what builds the most life. Let us protect the fragile, stay curious, and learn from our mistakes — together.

The constructive attractor does not demand uniformity. It demands only that we all face the same way, each with our own stories, and walk.
